

Celebrating World Ivermectin Day

The British Ivermectin Recommendation Development ([BIRD](#)) group and the World Council for Health ([WCH](#)) will be holding the Second World Ivermectin Day on Saturday, July 23. Established one year ago, the event is dedicated to sharing the evidence-based message that the safe and easily accessible drug ivermectin is highly effective when used early against Covid-19 and could put the pandemic behind us.

“We have an incredibly positive and uplifting message to share; Ivermectin treats and prevents Covid and it is the key to unlocking the never-ending cycle of pandemic peaks and personal restrictions and will help restart economies,” said Dr. Tess Lawrie, U.K.-based founder of World Ivermectin Day, when establishing the event.

Besides the BIRD and the WCH, the coalition of medical professionals, journalists, and artists raising public awareness of the benefits of ivermectin [includes](#) such well-known organizations as Frontline Covid-19 Critical Care Alliance (FLCCC), Trial Site News, Children’s Health Defense Europe, World Doctors Alliance, Coalition for Informed Consent, Doctors for Covid Ethics, Canadian Covid Care Alliance, French Association BonSens, and numerous other national and international groups.

Ivermectin is a decades-old antiparasitic and antiviral drug. It was first approved for human use in 1987. In 2015, scientists William Campbell and Satoshi Mura were awarded the Nobel Prize for their discovery of ivermectin, which has significantly reduced deaths from tropical infections.

After being administered a couple of million times to vulnerable populations, including children and pregnant women, the drug took center stage in April 2020, when Australian researchers from Monash University found that just a single dose could stop SARS-CoV-2 from growing in cell culture.

“We found that even a single dose could essentially remove all viral RNA by 48 hours and that even at 24 hours there was a really significant reduction in it,” Monash Biomedicine Discovery Institute’s Dr. Kylie Wagstaff [revealed](#).

All subsequent real-world and clinical studies showed the drug’s outstanding efficacy against Covid.

In his book *The Real Anthony Fauci: Bill Gates, Big Pharma, and the Global War on Democracy and Public Health*, attorney, activist, and Children’s Health Defense founder Robert F. Kennedy, Jr. noted,

Since March 1, 2020, some front-line ICU and ER doctors began using Ivermectin in combination with HCQ in early treatment protocols.... More than 20 randomized clinical trials (RCT) have confirmed its miraculous efficacy against COVID for both inpatient and outpatient treatment. Six of seven meta-analyses of IVM treatment RCTs completed in 2021 found notable reduction in COVID-19 mortality.

Written by [Veronika Kyrylenko](#) on July 22, 2022

The favorable medical data on ivermectin as a Covid early treatment keeps on coming.

According to WCH, to date, there are 174 ivermectin Covid-19 studies, of which 121 are peer reviewed, and 88 compare treatment and control groups.

According to the meta analysis of the ivermectin studies, the [results speak for themselves](#):

Statistically significant improvements are seen for mortality, ventilation, ICU admission, hospitalization, recovery, cases, and viral clearance. All remain significant after exclusions. 56 studies from 51 independent teams in 22 different countries show statistically significant improvements in isolation (38 primary outcome, 36 most serious outcome).

“The evidence supporting ivermectin for COVID-19 far exceeds the typical amount of evidence used for the approval of treatments,” note the scientists. That means that typically, regulatory bodies accept far lower efficacy rates for new drugs to sign off on their approval and recommendation. (Think [Covid vaccines for children](#).)

What makes ivermectin so effective against Covid?

Owing to its mechanism of action, ivermectin stops viral replication, meaning the virus can not reproduce and thus hurt the host. Besides that, it performs other important functions, including the following:

- Stops the virus from entering the cells;
- May stop viral protein traveling in and out of the cell nucleus;
- Reduces inflammation;
- Prevents blood clotting;
- Helps protect the heart;
- May help to repopulate the microbiome responsible for fighting off infections.

Despite the drug having a stellar safety profile and more promising efficacy characteristics against Covid, U.S. medical authorities advise against using it as a Covid treatment. That recommendation likely interfered with physicians’ ability to practice medicine from a patient-based perspective by directing them, their patients, and the public not to use ivermectin, according to the [latest lawsuit](#) against the the U.S. Food and Drug Administration (FDA).

The FDA led a deceptive smear campaign against ivermectin, depicting it as a “horse dewormer” not suitable for humans.

“You are not a horse. You are not a cow. Seriously, y’all. Stop it,” the agency tweeted on August 21, 2021.

You are not a horse. You are not a cow. Seriously, y'all. Stop it. <https://t.co/TWb75xYFY4>
— U.S. FDA (@US_FDA) [August 21, 2021](#)

On its website, America’s top regulatory agency [strongly warns](#) against using ivermectin, falsely claiming there’s no evidence that it works or that it is effective:

The FDA has not authorized or approved ivermectin for the treatment or prevention

Written by [Veronika Kyrylenko](#) on July 22, 2022

of COVID-19 in people or animals. Ivermectin has not been shown to be safe or effective for these indications.

In the best traditions of pandemic fear-porn-style messaging, the agency adds that those overdosing on ivermectin may experience a wide range of side effects, from nausea and vomiting, to “seizures, coma and even death.”

The U.S. Centers for Disease Control and Prevention (CDC) seems to be less dramatic in its assessment of ivermectin.

While [admitting](#) the drug is “generally safe and well tolerated” if used as prescribed, the CDC recommends against using it as Covid treatment. Interestingly, the [agency advises](#) all foreign refugees to take ivermectin for at least five days before coming to America, without specifying the purpose.

Speaking with *The New American* on several occasions, the president and co-founder of FLCCC, Dr. Pierre Kory (see [here](#) and [here](#)) described how the ongoing war against ivermectin and other early treatments has caused and continues to cause large numbers of unnecessary deaths. The core issue is that the federal government is acting under regulatory capture and serving Big Pharma. Until the agencies are restructured, the advice that they produce will not be in the interests of the patients, said Kory.

Speaking recently with *The New American*, [Dr. Tess Lawrie](#) suggested people take more responsibility for their own health and well-being.

The online streaming of the World Ivermectin Day starts on Friday at 7:00 PM Eastern Time.

“You can help us spread critical awareness about Ivermectin this July 23 by joining or hosting an event and sharing information on social media,” note the organizers.
