Data Scientists Show More Than 432,000 Trump Votes Removed in Pennsylvania

As allegations of voter fraud continue to come forward — only to be dismissed out of hand by Democrats — a group of data scientists with the Data Integrity Group say they have uncovered evidence that more than 432,000 Trump votes were nixed in Pennsylvania. Those vote removals happened during the vote tabulation process, and this happened in at least 15 counties across Pennsylvania, according to a report by *The Epoch Times*.

That report includes a video presentation from those data scientists that shows the breakdown of the removed votes. The report states that vote removals included both Election Day (in-person) votes and absentee votes:

lisafx/iStock/Getty Images Plus

> The group said that Election Day vote removals happened during the vote tabulation process in at least 15 counties, including Lehigh County, Chester County, Allegheny County, Armstrong County, Westmoreland County, Northampton County, Delaware County, Montgomery County, Lackawanna County, Dauphin County, Pike County, Carbon County, Washington County, Erie County, and Luzerne County.
>
> Meanwhile, absentee vote removals happened in Allegheny County, Chester County, and Lehigh County.
>
> At least 432,116 votes — 213,707 election day votes and 218,409 absentee votes — were removed in total.

It goes on to say that though there were "vote movements across all candidates," there was one major difference. "We did not see the same type of negative decrements to any of the [other] candidates that

we saw with President Trump's tallies, and they happened repeatedly with no explanation," Lynda McLaughlin, a member of the group, told *The Epoch Times*.

And while — as stated above — Democrats have dismissed claims of election fraud without so much as a passing glance at the evidence, it should be noted that the Data Integrity Group is not a consortium of tinfoil-hat-wearing fringe lunatics. On the contrary, their *bona fides* are impressive. As *The Epoch Times* reported:

> The Data Integrity Group is a group of scientists, engineers, and machine learning experts who have been working together to check whether or not there was manipulation of data in the 2020 general election.
>
> The group's lineup of data scientists includes Justin Mealey and Dave Lobue.
>
> Mealey is a nine-year veteran of the U.S. Navy, where he worked as an electronic warfare technician, cryptologic technician, and Arabic linguist. He worked at the NSA as a mission manager for Levant/North Africa and later worked as a CIA contractor at the National Counter-Terrorism Center.
>
> Lobue has 12 years of experience in data science and machine learning across financial services, telecommunications, and research consulting industries. He currently specializes in artificial intelligence applications.

This is a far cry from the wild, unsubstantiated claims Democrats and their mainstream-media accomplices made about election fraud during the 2016 election. Only then, those claims led the news cycles as "facts" — though no evidence was ever offered to prove their claims.

And the Data Integrity Group is careful to stick to verifiable facts and demonstrable data. Not making claims about blame or jumping to any conclusions about what may have caused the removal of the votes, the group told *The Epoch Times*, "The bottom line is the errors were made. Data confirms these errors and it shouldn't matter if they were machine or human, they're still errors and deserve a second review and thorough analysis with forensic audits to find the answers."

Indeed. But Democrats and other establishment types do not appear to want answers. They already have the only "answer" they want: Biden won according to the count, and that is that. Nothing else to see here, folks.

As such, the report from *The Epoch Times* states:

> Pennsylvania's electors cast their votes for Biden and Kamala Harris as president-elect and vice president-elect on Dec. 14, 2020.
>
> State-certified results show Biden won the Keystone State by 80,555 votes.

But, if 432,000 Trump votes were removed, that 80,555 gap closes considerably. And — here, this writer will speculate, though given what is known, the speculation is not wild — if *any sizable number of those votes* were counted for Biden, that gap may disappear altogether, meaning that Trump *actually* won Pennsylvania.

To show that such a possibility is not a stretch, consider that — as *The Epoch Times* reported — a

widely-circulated video clip of CNN's live election night broadcast shows 19,958 votes being switched from Trump to Biden in 30 seconds.

That "oops" moment was brought to you by Edison Research and was corrected. But then that error was broadcast nation-wide on CNN. How many such errors were not seen on your television and computer screens and therefore *not* corrected?

None of this is about partisan politics and which candidate won. Instead, it is about the integrity of the entire election process. If the establishment can simply slap its imprimatur on a victory that has so many unaddressed problems stemming from what appears to any honest person to be fraud, then moving forward, the United States has an election system that makes banana republics look honest by comparison.
